

Joe Schmoe purchases a new radio-controlled vehicle from a seller on Ebay as a birthday present for his friend, Jim Bob. Upon receiving the vehicle, Joe discovers that his friend already owns this model. Joe then decides to sell the vehicle on Ebay himself for \$10 more than he was charged. Since he is new to Ebay, Joe must setup an account and pay the current installation fee of \$5.85. In addition, Ebay charges a 2% charge for each item sold (based upon the sale price).

Write a program that asks for the original price paid by Joe Schmoe for the vehicle. In either a field or in a message box, display the amount of profit Joe will make on this re-sale (if any), to the nearest penny.

Your output windows should look like this:
